User Interface – Main Window Overview

- User Input
- Model Settings
- Model Results
- Nearest Neighbours

Main Window: User Input

- **1** SMILES input line:

 User enters a SMILES for the chemical they wish to run through the model
- **2** CAS input line:

 User enters a CAS which searches the selected database for a match. Additional option to perform online search for CAS available.
- **3** Opens the user manual
- 4. Batch Mode Options

 Check box toggles Batch mode, once activated the user must select a text file containing the list of SMILES to run through the models.

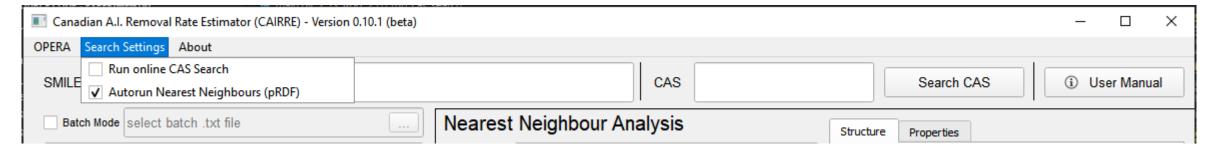

Note: This disabled Nearest Neighbours

- **5** Converts the SMILES in 1 to structure
- 6 Shows the structure of the SMILES in 1

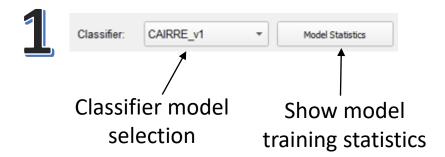

Main Window: User Input (continued)

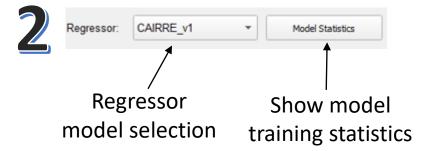

Two additional search options available on the toolbar:

- 1. Run online CAS Search: allow CAIRRE to search the internet for a SMILES corresponding to a provided CAS. If selected this will automatically be performed when the "Search CAS" button is pressed.
- 2. Autorun Nearest Neighbours (pRDF): automatically run the Nearest Neighbour analysis when the "Search CAS" or "Convert SMILES to Structure" buttons are pressed. This is performed using the pRDF descriptor.

Main Window: Model Settings

Rerun OPERA: This option forces CAIRRE to rerun the OPERA calculations from scratch. Use this option when results for CAIRRE read as *Failed*.

4. Run the models

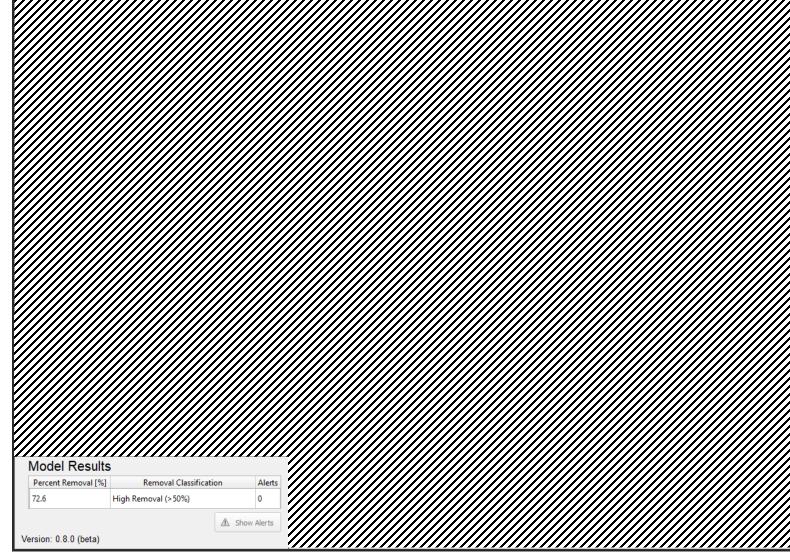

Main Window: Model Results

This section of the main window provides the user with:

- Predicted percent removal
- Predicted removal classification
- Alerts:
 - While running the substance through the A.I. models, CAIRRE will perform a series of checks to ensure that:
 - a) The substance is within the effective domain of the models
 - b) The Classifier and regressor results do not contradict
- Button to see details on the identified Alerts

Note 1: This section will not be used when batch mode is selected.

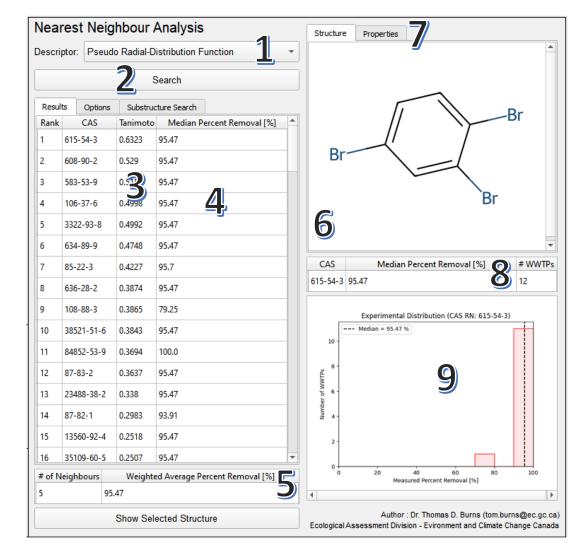

Note 2: If *Percent Removal* or *Removal Classification* reads as *Failed*, click *Rerun OPERA* option and rerun the model (see page 6).

Main Window: Nearest Neighbour Analysis

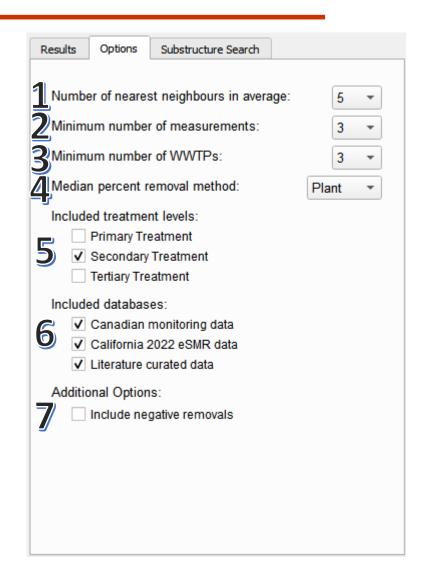

- Select the descriptor to use to check for similarity
- Run the search

 Note: search is run automatically when models are run
- Tanimoto similarity for each substance, a value from 0.0 to 1.0: 1 = Identical, 0 = completely dissimilar
- 4. SMILES of the substance in the training set
- A weighted average of N nearest neighbours (can be edited under the Options tab)
- Structure of selected SMILES (default SMILES with highest Tanimoto)
- Phys-chem properties for the substance calculated using OPERA version 2.7.
- Information on identity and median experimental removal for the selected SMILES
- Histogram of the experimental removals for the selected SMILES

Options: Nearest Neighbour Analysis

- Select the number of nearest neighbours to include in the weighted avearge
- Set the minimum number of observations of removal efficiency are needed for a chemical to be included in the database query
- Set the minimum number of WWTPs with experimental removal efficiency observations for a chemical to be included in the database query
- How should the median removal efficiency be calculated:
 - Plant: Median value of the median removal values calculated for each individual WWTP (recommended)
 - Global: Median of all individual removal observations with no consideration for the WWTP where it was measured
- WWTP Treatment levels included in the database query
- Select which database to query
- Include negative removal efficiencies in the WWTP database queries

User Interface – Output Window

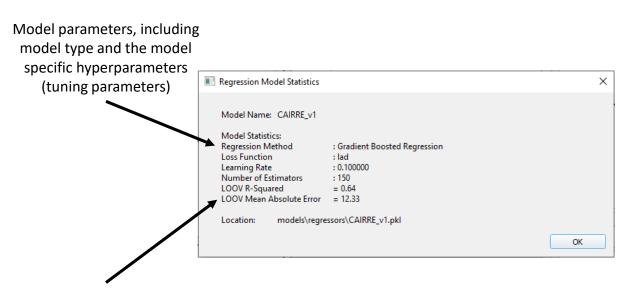

After Launching the WWTP program, you may notice a second output window also launched that resembles a command terminal. This window will display the raw output from your calculations, including a progress bar used during the generation of the model descriptors. It will also display error information if any errors arise during the calculation.

User Interface – Model Statistics

Each model selected will have separate pop-up windows, one for the regressor and another for the classifier. These windows contain information on the model's training performance, based on Leave-One-Out-Validation (LOOV) results.

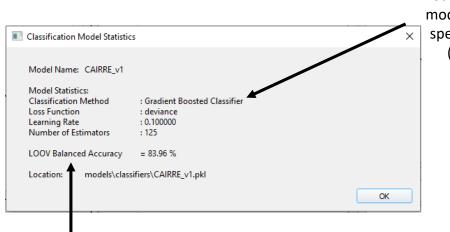

Regressor Model Statistics

The results of the Leave One Out Validation (LOOV) for the selected model, including the Pearson R² and the Mean Absolute Error for the predictions.

Note: Clicking the Regressor's Model Statistics button also provides a scatter plot of the LOOV-validation, showing the predicted vs actual percent removals.

Classifier Model Statistics

Model parameters, including model type and the model specific hyperparameters (tuning parameters)

The Balanced Accuracy value obtained by the model from the LOOV analysis.

$$Balanced\ Accuracy = 100\% \left[\frac{1}{2} \left(\frac{True\ High}{All\ High} + \frac{True\ Low}{All\ Low} \right) \right] \quad \begin{array}{l} \textit{Where:} \\ \textit{High} >= 50\% \\ \textit{Low} < 50\% \end{array}$$

Running the Code – Batch Mode

If a large number of substances need to be processed, the WWTP prediction code can also be run in **Batch Mode**. To run in **Batch Mode**, toggle the option in the main window, and then press the '...' button (....) to navigate to your text file. This text file should contain the list of SMILES you wish to run, with one SMILES per line. Once the substance is loaded, simply press "Run Model".

This calculation will likely take several minutes, the progress bar can be found in the *Output Window*.

Once completed the code will prompt the user to save the results to a csv file.

⊿	В	с	D	E
1 SMILES	Predicted Percent Removal [%](Oxnard_v1)	Predicted Classification (Oxnard_v1)	Out of Domain?	Models Contradict?
2 CIC=1C=C2OC3=CC(CI)=C(CI)C=C3OC2=CC1CI	7.854385316	Low Removal (<50%)	FALSE	FALSE
3 CI[C@]12[C@@]3([C@]([C@](CI)(C1)CI)C(CI)=C2CI)([C@]4(C[C@@]3([C@H]5[C@@H]4O5)[H])[H])[H])[H]	89.19150295	High Removal (>50%)	FALSE	FALSE
4 CIC1=C(CI)C2(CI)C3C(CI)C=CC3C1(CI)C2(CI)CI	87.63030341	High Removal (>50%)	FALSE	FALSE
	87.10578959	High Removal (>50%)	FALSE	FALSE
6 CI[C@]12[C@@]3([C@]([C@](CI)(C1(CI)CI)C(CI)=C2CI)([C@@]4(C[C@]3(C=C4)[H])[H])[H])[H]	89.19150295	High Removal (>50%)	FALSE	FALSE
7 CI[C@]12[C@@]3([C@]([C@](CI)(C1(CI)CI)C(CI)=C2CI)([C@@H](CI)[C@@H]4[C@H]3O4)[H])[H]	89.73107489	High Removal (>50%)	FALSE	FALSE
0=S1(=O)OCC2C(CO1)C3(Cl)C(Cl)=C(Cl)C2(Cl)C3(Cl)Cl	87.07045194	High Removal (>50%)	FALSE	FALSE

Note: The model used to generate each prediction is included in brackets in the column header, and Out of domain and model contradiction errors are flagged as True in the relevant columns. If the value in these columns is False, that alert was **NOT** present for the substance.

Formatting Graphs – Formatting & Saving

The WWTP prediction code provides the user with several different plots. Depending on the user's screen resolution or aspect ratio, the plots may need some formatting.
